Essential Facebook security tips for iPhone users

The world of grey IT means both enterprise and consumer users frequently use popular social networking service Facebook on their devices. It makes sense, then, to stay safe while using it.

Manage Facebook Security settings

First things first: Always use a complex passcode with your account and do make sure to set up two-factor authentication.

Now that you've done that, you'll find Facebook's own privacy settings live inside *Privacy Shortcuts* in the iOS app. Get to these by tapping the three-line icon at bottom right of the Facebook app and scrolling down to *Privacy Shortcuts*. The first thing you should do is run *Privacy check-up* (at the top of the page). Facebook will guide you through your existing settings, change them for maximum privacy, and delete any Facebook apps you've forgotten about or no longer use.

Once you've completed that process, here are the settings you should change:

What do strangers see?

Want to know what strangers can find out about you when they visit your page? You'll need to access Facebook using a computer and tap the *...* just beside *View Activity Log* on your profile page. Tap *View As* from the list that appears, and you can take a look at how the world sees you.
